RP DISTORT

User GuidePowered by RPCX

Patch and Global Section

At the top of the RP DISTORT- RE window you find the patch control section, modulation and global controls.

Patch Controls

RP DISTORT-RE uses the standard Reason patch controls. Clicking on the patch menu, brings up a list of patches in the current folder and clicking on the up / down buttons next to the menu allows you to scroll though the these patches.

The Patch Browser button will bring up the patch browser, allow you to load in patches from other bank folders.

The Save Patch button, allows you to save the current patch.

Mod Wheel

This simulates mod wheel input into RP DISTORT-RE

Bypass

The bypass switch turns the RP DISTORT-RE effect on and off.

DC Filter

Some of the distortion types in RP DISTORT-RE add a DC offset to the signal (such as the Rectification effect). We have added a DC filter after the distortion to remove this offset. The DC Filter is on by default, but you can turn it off here if you want to.

Mix

The mix control sets the balance between RP DISTORT-RE"s wet output and the original dry signal. The range is from 100% dry (only the original signal) to 100% wet (only the processed signal).

Path Menu

The path menu gives you access to the way in which the RP DISTORT-RE modules are interconnected.

Distortion Unit

The Distortion Unit is the heart of RP DISTORT-RE. It consists by the EQ unit and then the Noise-Gate unit.

Distort Unit

RP DISTORT-RE offers 22 different distortion types allowing for a wide sonic range of distortion effects. Every distortion type gives access to a different set of controls. The controls are listed for each of the effect types in this section. Let's have a look first at the controls available for all effect types. They are listed in the following table:

On/Off	The "Distort" button turns the distortion effect (Distort Unit) on and off
Volume	Total volume of the distortion
Туре	The typed drop down menu selects the type of distortion being applied.
Pre	Pre-distortion volume boost. Higher settings will drive the distortion circuit harder
Normalize	Determines the amount with which the distortion output volume is normalized relative to the input volume. At 100% the output volume is of similar to that of the input signal.

The distortion types use various techniques to create the distorted sound. In general all distortion types add harmonics (overtones) to the original signal. The level, odd / even balance and spacing of the harmonics, determine the character of the distorted signal.

Distortion Types and Controls

Amp Simulator

The Amp Simulator effect imitates a complete (guitar) amplifier. When driven hard, each amplifier type produces a style of distortion that is characteristic for its model

Туре	Type of amplifier simulation. Settings are:- None, Fender, Marshall & Off Axis.
Distort	Amount of distortion added to the sound.

Cabinet Simulator

The Cabinet Simulator effect imitates a guitar cabinet (amplifier and speaker). When driven hard, each cabinet produces a signature sound, associated with its brand and model.

Туре	Type of cabinet simulation. Settings are:- None, 4x10" guitar speakers, 4x12" guitar speakers, Bass speaker, Combo speaker and Radio speaker.
Distort	Amount of distortion added to the sound.

Clipper

The clipper distortion literally chops off the tops of the peaks in the audio waveform. The RP DISTORT-RE clipper allows for separate settings for the negative and positive part of the waveform.

Negative	The clipping level for the negative signal. From 0% (no clipping) to 100% (maximum clipping).
Positive	The clipping level for positive signal. From 0% (no clipping) to 100% (maximum clipping).
Amount	The amount of clipping from 0% (no clipping) to 100% (fully clipped)

Cos

Cosine distortion effect.

Frequency	Frequency of the cosine effect.
Amount	Amount of cosine distortion

Cross 1

Cross distortion type 1.

Cross	Position for cross distortion
Amount	Amount of cross distortion

Cross 2

Cross distortion type 2.

Negative	Cross distortion position for the negative signal
Positive	Cross distortion position for the positive signal.
Amount	Amount of cross distortion.

FoldOver

Fold-over distortion, this amplifies and then 'folds over' the sound.

Frequency	Frequency of the fold-over distortion.
Amount	Amount of fold-over distortion.

Fuzz

Fuzz-box distortion is based on the effect of overdriven transistors in an electronic circuit.

Frequency	Frequency of the fuzz-distortion effect
Amount	Amount of fuzz distortion

Gapper

Gapper distortion,

Frequency	Frequency of the gapper distortion effect
Amount	Amount of fuzz distortion

Hard-limiter

The hard limiter limits output which is to above a pre-set level (limit) and subsequently boosts the signal.

Limit	The clipping level for the signal. From 0% (no limiting) to 100% (maximum limiter).
Amount	The amount of post-limiting boosting.

Low-Fi

The Low-Fi effect, this reduces the precision with which the signal is being reproduced. It does this by reducing the sample rate, the bit rate and adds noise to the signal.

Bits	Bit level of the signal.
Sample Rate	Sample rate of the signal.
Noise	Amount of noise added to the signal

OverDrive

The overdrive effect is a classic style of distortion whereby electronic components were driven too hard by the input signal.

Drive	Drive for the over-drive effect
Amount	Over-drive mixing amount

Octave 1

Octave effect which shifts the sound up an octave,

Negative	Mixing for the negative signal
Positive	Mixing for the positive signal.

Octave 2

Octave effect type 2,

Frequency	Frequency of the octave effect.
Amount	Amount of octave effect.

Power

Power wave-shaping effect.

Drive	Drive for the power effect
Amount	Power mixing amount.

Rectify

Rectify works by inverting (flipping-over) the negative part of the audio waveform so that it becomes a positive signal.

Rectification	Rectification of the negative signal, from -100% (no rectification), 0% (half rectification) to 100% (full rectification)
Amount	Rectification mixing amount.

Ring Modulation

The ring modulates (multiplies) the input signal with an RP DISTORT-RE generated oscillator signal. It typically creates metallic non-tonal overtones.

Туре	Sets the waveform of the RP DISTORT-RE oscillator. Choose between Sine, Saw, Square and Triangle
Frequency	Sets the oscillator frequency.
Amount	Sets the ring modulation amount.

Saturate

The saturation effect is a subtle type of distortion that is associated with a warm, analogue sound. It is derived from the time when recordings were made on magnetic tape. The tape could only hold so much of a magnetic load (which represents the audio signal). As higher levels of audio required a higher magnetic load, the tape could get saturated and the magnetic field did not accurately reflect the audio signal anymore. The distortion this generated is reproduced here.

Saturation	Saturation level
Amount	Saturation mixing amount

SoftLimit

The soft limiter is a gentler version of the hard limiter effect.

Amount	Soft-limiter amount	
--------	---------------------	--

Squarify

Squares the signal (turns it to a square wave), which generates a lot of new overtones (harmonics). The low-pass filter is there to bring those harmonics back under control.

Negative	Amount the negative signal is turned to a square wave
Positive	Amount the positive signal is turned to a square wave
Filter	Amount this square wave is lowpass filtered.

Transient

The transient type distortion affects the transients of the signal. The transients are the impulse-like (peak) sections at the beginning of sound or waveform.

Range	Transient range
Amount	Transient distortion amount

Tube Simulator

The classic tube distortion is an effect that combines saturation, limiting, rectifying and a band-pass filter of the input.

Limit	Hard limiter threshold.
Rect	Amount of rectification, from -100% (no change), 0% (half) to 100% (full).
Saturate	Amount of saturation
Tone	Frequency of the band pass filter.
Emphasis	Bandwidth of the band pass filter.

EQ Unit

The EQ Unit is a four (4) Band Equalizer. The frequency bands are fixed at 125 Hz, 500 Hz, 2 kHz and 8 kHz. Each frequency band can be boosted or attenuated independently.

On / Off	The "EQ" button turns the EQ effect on and off
Low	125 Hz volume
Mid 1	500 Hz volume
Mid 2	2 kHz volume
High	8 kHz volume

Noise-Gate Unit

The noise-gate is an audio effect that removes any signal ('gates') that is below a threshold volume. It is typically used to keep noisy effects under control when no or a very low input signal is present. Distortion effects work with potentially very high internal amplification levels, which may lead to higher noise levels in the output stage.

On / Off	The "Gate" button turns the noise-gate effect on and off
Threshold	This sets the threshold (signal level) below which the noise-gate starts to work.
Attack	This sets how long the noise-gate takes to reduce the volume to zero after the noise-gate is triggered.
Hold	This sets how long the input volume has to below the threshold volume before the noise-gate is triggered.
Release	This sets how fast the noise-gate returns to normal after the input volume passes the threshold level again.

Filter, Compressor & Widener

Filter

RP-Distort RE has a low and a high pass filter. The filters are connected in series, where the low-pass filter feeds into high-pass filter

12 / 24 DB	Selects between a slope of 12db/octave and a 24db/octave. The 24db slope filter works more rigorously and has a more pronounced character than the 12db one.
Low	Filter frequency of the low pass filter
Low Q	Resonance of the low pass filter
High	Filer ftrequency of the high pass filter
High Q	Resonance of the high pass filter

Compressor

The compressor is an audio effect that manages the dynamic range and response of a signal.

Threshold	This sets the threshold at which the compressor starts to work.
Ratio	This sets the amount of dB reduction. So with a ratio setting of 1:2, and the signal exceeds the threshold by 4dB then it is reduced by $4db/2 = 2db$ ".
Attack	This sets how fast the compressor kicks in after the signal passes the threshold level.
Release	This sets how long the compressor takes to react to a reduction in volume where the signal falls below the threshold level again.
Volume	This sets the volume of the post-compression signal

Widener

This effect widens the stereo sound. It creates a spatial effect that generates a stereo image with a mono signal as input.

Amount	Stereo widening amount
Width	Maximum spread (between left and right channels) of the stereo effect
Speed	Speed at which the stereo widening amount is being modulated.

Modulation

The modulation section gives you the opportunity to change RP DISTORT-RE parameters dynamically. For this purpose there are 4 independent LFOs and 4 freely configurable modulation slots at your disposal. There are two controls that affect all modulators simultaneously:

Bypass	Bypasses all the modulation & LFO controls
Global	Adjusts modulation and LFO amounts for all modulation paths simultaneously.

LFO

The LFO section sets up four modulation paths, one for each LFO.

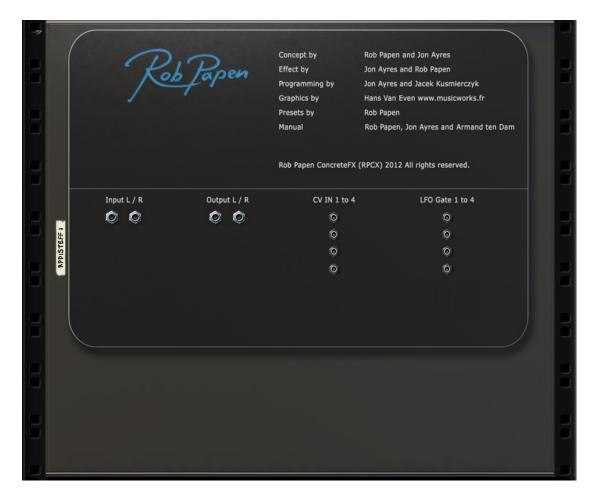

Wave	Selects the LFO Waveform, there are 6 shapes to choose from: - Sine, Triangle, Saw Up / Down, Square and Sample and Hold
Free	This is an on/off switch. When off, Reason resets the LFO when it starts playing. When on, the LFO is free running and is never being reset.
Speed	Sets the frequency or speed of the LFO waveform ("how fast the LFO is running"). If " <i>Sync</i> " is active, the LFO speed is synchronised to the Reason's tempo.
Sync	This determines whether the LFO's speed is synchronised to Reason's tempo.
Human	The human control brings in slight variations (inaccuracies) to the LFO speed.
Shape	This controls the symmetry of the waveform, or how quickly the LFO waveform reaches its middle point. It can be used to alter the pulse width of the square LFO.
Destination	Sets the target parameter to be modulated by the LFO signal

Mod

The modulator section allows you to configure RP-Distort RE's four modulator slots to set up 4 independent paths to dynamically alter RP-Distort RE's parameters.

Source	Selects the modulation source.
Destination	Sets the target (RP DISTORT-RE parameter) for the modulation source
Amount	Sets the strength with which the source changes the modulation target.

Back Panel

Click on the Rob Papen logo to go to the RP DISTORT-RE back panel. You will find a number of inputs and outputs. The back panel also lists the program credits.

Input L/R

The L/R stereo inputs are where you connect an audio signal to RP DISTORT-RE.

CV Input

RP DISTORT-RE has four independent CV inputs, which can be used as modulation sources.

LFO Gate Input

The four LFO Gate inputs are used to reset the LFOs 1 / 2 / 3 / 4.

Output L/R

Here you grab RP DISTORT-RE's stereo output signal to connect to other Reason instruments and effects.
